Diabetes means there is too much sugar in the blood.

With diabetes your body has a hard time changing the food you eat into the energy you need. This causes too much sugar in the blood. If not managed, high blood sugar can slowly damage your heart, kidneys, eyes, and feet.

Although there is no cure for diabetes, you can manage it by:

- Eating healthy
- Staying active
- Testing your blood sugar levels
- Taking medication if needed
- Seeing your doctor for needed exams
Types of Diabetes

When you have diabetes, your body has problems making and using insulin. Insulin is a hormone made by the pancreas. It helps move sugar, also called glucose, from the blood into the cells of the body. The cells are then able to use the sugar for energy.

• Type 1: When you have **Type 1** diabetes, your pancreas doesn’t make insulin. You need to take insulin prescribed by a doctor several times each day.

• Type 2: When you have **Type 2** diabetes, your pancreas doesn’t make **enough** insulin or your insulin does not work well enough. Over time your body makes less and less insulin. Many people with Type 2 diabetes will need to take insulin prescribed by a doctor at some point.

Do you know what type of diabetes you have?

☐ Type 1 Diabetes  ☐ Type 2 Diabetes

What questions do you have about your type of diabetes? ____________

________________________________________________________

________________________________________________________
If you have diabetes, what and how much you eat has a big effect on your blood sugar.

**Helpful Tips**

- Eat 3 well balanced meals each day about 4 to 5 hours apart. Do not skip meals.
- Eat about the same amount of food from meal to meal and day to day.
- Pick whole grains most often. (All carbohydrates turn into sugar but some carbohydrates are better for you than others.)
- Eat more salads and vegetables.
- Be careful with the sweets and desserts. Regular soda and sports drinks have lots of carbohydrates too.
- Olive or canola oil and avocado are good fat choices. Cut down on saturated and trans fats.
- Keep snacks close by to keep from getting too hungry and eating unhealthy foods.
- Use the MyPlate® method for diabetes to plan your meals.
Because sugar comes from the foods you eat, it is important to eat the right foods in the right amounts.

**MyPlate for diabetes**

The MyPlate® method for people living with diabetes is a way of planning each meal to make sure it’s healthy and balanced.

**Build a healthy MyPlate for diabetes:**

Think of your plate as having 4 equal sections.

1. Fill 2 sections (1/2) of your plate with vegetables.
2. Fill 1 section (1/4) of your plate with lean protein like fish, chicken or turkey.
3. Fill 1 section (1/4) of your plate with carb foods. Choose whole grains to fill this section.
4. Have one small serving of fresh fruit per meal. (Fruit juice is not a replacement for fruit.)
5. Have water or one cup of non-fat milk or unsweetened non-dairy milk like soy or almond milk with your meal rather than a sweetened or “diet” drink.
Know about Carbohydrate Foods

Carbohydrates (carbs) are foods that turn into sugar in your body. When you have diabetes it is important to know which foods have carbs. Sweets, starchy foods, fruits, and milk are carb foods. Fill 1/4 of your plate with a starchy food and have a fruit and milk to complete the carbs for your meal.

These foods have carbs:

**STARCHES/GRAINS**
- Bread
- Cereal
- Chips
- Crackers
- Noodles
- Oatmeal
- Pasta
- Rice
- Tortillas

**STARCHY VEGETABLES**
- Beans
- Corn
- Potatoes
- Peas
- Sweet potatoes
- Yams
Helpful Tip

Some drinks also have carbs. Have juices, fruit drinks, regular sodas, and sugar sweetened coffee or tea in moderation.

Alcohol can cause low blood sugar and should be limited. If you drink alcohol, ask your doctor or diabetes care team how to do so safely. It is recommended to keep alcoholic drinks to 1 drink a day. It is best to not to drink on an empty stomach.
Eat Lots of Non–Carb Foods

These foods have little or no carbs. They do not have a big effect on blood sugar. Fill 1/2 of your plate with vegetables and 1/4 with lean protein foods.

**PROTEINS**
- Chicken
- Egg whites
- Fish
- Lean meat
- Tempeh
- Tofu
- Turkey

**MOST VEGETABLES**
- Asparagus
- Broccoli
- Cauliflower
- Romaine lettuce
- Spinach
- Tomatoes
- Zucchini
Use healthy fats to prepare your meals. Boil, bake, or barbecue food instead of frying.

**HEALTHY FATS**
- Avocado
- Canola oil
- Flax seed oil
- Nuts
- Olive oil
- Peanut oil

**NOT-SO-HEALTHY FATS**
- Butter
- Lard
- Shortening
- Some cheeses
- Sour cream

What foods would you choose to make a healthy plate?
Know the Right Amount

The good news is you don’t have to cut out carb foods completely to manage diabetes. Eating a smaller portion size is what counts!

<table>
<thead>
<tr>

ANSWERS:

Not a Carbohydrate Food: Fish, Avocado, Lettuce, Nuts, Corn Oil.

Yes Carbohydrate Food: Cereal, Corn, Potato, Milk, Juice.
Living Well: Be Active

Living an active life can:

- Lower blood sugar levels
- Lower blood pressure
- Improve heart health
- Help with weight loss
- Increase energy and strength
- Relieve stress

Here are some ways to add physical activity to your day.

Helpful Tips

- Talk with your doctor before you start an exercise program.
- If you are not active now, start slow with about 10 minutes a day. Add a few minutes each day until you are active for about 30 minutes a day or 150 minutes a week.
- If you’re new to exercising, walk around the block to get started.
- Do activities with a friend to make it more fun.
- Track what you do as a way to keep you motivated (see page 31).
- If you will be exercising more than usual:
  - Carry a fast sugar source with you. (See section on how to treat low blood sugar.)
  - Check your blood sugar before and after exercise. If it’s low, you may need a small snack.
Regular physical activity is important for managing diabetes.

**What can you do to be more active?**

Circle the activities you enjoy the most. It’s best to do at least one activity from each column.

### Aerobic
- Swimming
- Dancing/Zumba
- Walking

### Strengthening
- Using Resistance Bands
- Gardening
- Free Weights

### Stretching
- Yoga
- Simple stretching
- Tai chi

How many times a week will you do those activities? ________________

For how many minutes each time? ___________________________

---

**Helpful Tip**

Losing weight can help manage diabetes. Losing just 10-15 pounds can make a difference in the amount of sugar that stays in your blood.

You can also take a free exercise class at one of our Family Resource Centers! We offer lots to choose from such as Zumba, yoga, and strength training. To find a Center near you, call **1.877.287.6290**.
When you have diabetes, your blood sugar (glucose) levels tend to be high. Over time, this can damage your body and lead to other problems. This is why it’s important to know your blood sugar levels.

There are two types of tests to measure your blood sugar. You need both of these tests.

- The A1c test is a lab test that shows your average blood sugar level over the last 3 months. Know your A1c. It tells you and your doctor if your blood sugar has been close to normal or too high during the last 3 months.

- A blood sugar (glucose) test measures your blood sugar at the time you test. You can do this test yourself using a meter and test strips. This test helps with daily choices to better manage diabetes. Know your target blood sugar numbers for when you are fasting, before meals, after meals, and at bedtime.
You can prevent complications and live well with diabetes.

For many people with diabetes, the A1c goal is less than 7. Lowering A1c levels by any amount improves your chances of staying healthy.

<table>
<thead>
<tr>
<th>Risk for Complications</th>
<th>A1c</th>
<th>Blood Sugar</th>
</tr>
</thead>
<tbody>
<tr>
<td>I feel GOOD</td>
<td>Low</td>
<td>Under 7</td>
</tr>
<tr>
<td>I DO NOT feel good</td>
<td>High</td>
<td>Between 7 - 9</td>
</tr>
<tr>
<td>I feel AWFUL</td>
<td>Very High</td>
<td>Greater than 9</td>
</tr>
</tbody>
</table>

You can prevent complications and live well with diabetes.

Helpful Tips to lower blood sugar levels:

1. Eat healthy
2. Take your medications as directed
3. Stay active
4. Manage stress and anxiety
5. See your doctor regularly

Ask your doctor about a good A1c goal for you.
Low Blood Sugar (Hypoglycemia)

What causes low blood sugar?

- Missing a meal or eating later or less than normal
- Skipping your usual snack
- Taking too much diabetes medicine
- Doing more activity than usual
- Drinking alcohol

Signs of low blood sugar:

- Sweaty or clammy
- Shaky, lightheaded, dizzy
- Irritable, confused
- Hungry

Helpful Tips

If your blood sugar is 70 or below, drink or eat an emergency snack with 15 grams of simple sugar such as:

- 4 ounces of juice or regular (non-diet) soda
- 3 to 4 glucose tablets
- 1 tablespoon of sugar or jelly
- 5 small pieces of hard candy such as “Life Savers”

Wait 15 minutes and check your blood sugar. If it is still under 100 have another serving of the foods listed above.

- Don’t treat low blood sugar with chocolate. It does not raise blood sugar fast enough.
- Carry your blood glucose meter and an emergency snack with you at all times.
- If you are not able to check your blood sugar but think it is low, treat it with an emergency snack.
- Eat your next meal as soon as possible.
It is normal for your blood sugar to change throughout the day. It’s important that your blood sugar doesn’t go too high or too low.

High Blood Sugar (Hyperglycemia)

What causes high blood sugar?

- Eating food high in carbs, which turns into sugar
- Not taking your diabetes medicine
- Not getting enough exercise
- Being sick or in pain
- Stress

Signs of high blood sugar:

- Very hungry and thirsty
- Headaches and fatigue
- Frequent need to urinate (pee a lot)
- Dry mouth, dry itchy skin
- Blurred vision

Helpful Tips

If your blood sugar is over 180:

- Drink extra water (2 extra 8 oz. glasses).
- Exercise – go for a walk. Ask your doctor if it is okay to exercise when your blood sugar is high.
- Eat fewer foods with carbs at your next meal.
- Call your doctor if your blood sugar is over 250 after testing two or more times.

Talk with your doctor if your blood sugar is frequently too low or too high. Your diabetes medicine may need to be adjusted.
Managing Medications

Taking medicine to control your blood sugar levels is normal. Most people with diabetes also need meds for other health problems, like high cholesterol or high blood pressure. It is very important to take your meds as directed by your doctor.

There are different types of diabetes medication. Each type works in its own way to control blood sugar.

There are 3 types of diabetes medications
- Pills
- Non-insulin injectables (shots)
- Insulin injectables (shots)

Keep track of your medications
- Take your medicines at the right times.
- Fill a pill box with the medicines for the week.
- Keep your medicines in the original bottles until you put them in the pill box.
- Take your medicines at the same time every day.
- Use a chart, calendar, or timer to help you remember.

Talk with your doctor about your medications
Use these tips to get ready for your next doctor visit:
- Write down your questions.
- Keep a list of your medicines.
- Write down any side effects of each medicine.
- Bring all your medicines to each visit.
<table>
<thead>
<tr>
<th>When do I take this medicine?</th>
<th>Medicine Name</th>
<th>How much should I take?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Morning</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Noon</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Evening</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Only when I need it</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Helpful Tip

Bring your medications with you to each visit. Your diabetes medications may change over time.
Preventing Complications: Your Feet

Blood sugar above your target numbers can cause two problems with your feet over time:

1. Nerve damage  
2. Decreased blood flow

Because of these problems, a sore, bruise or infection may take longer to heal and lead to other problems. If not treated, these problems can lead to amputation (loss of a limb). Smoking makes blood flow problems much worse.

3 Steps to take care of your feet

Step 1: Check

• Look at your feet each day. Check for sores, blisters, redness, calluses, or other problems.
  ✓ Do not pick or peel the skin on your feet.
  ✓ If you cannot check your feet by lifting them up, use a mirror or ask someone else to check your feet.

• Tell your doctor right away about any foot problems.
  ✓ Have your doctor check your feet at each visit. Ask if you need to see a podiatrist (special foot doctor).
A common complication is foot problems. Taking care of your feet each day helps find problems early.

**Step 2: Clean**

- **Wash your feet in warm water each day. Do not use hot water** or soak your feet.
- Dry your feet well, even between your toes.
- **If your skin is dry, rub lotion on your feet after you wash and dry them.** Do not put lotion between your toes.
- **File corns and calluses gently with an emery board.**
- **Cut your toenails straight across.** Do not cut into the corners.

**Step 3: Protect**

**Never walk barefoot.** Always wear shoes or slippers, even when you are at home.

- **Always wear socks or panty hose.** Do not wear socks or stockings that are too tight below your knee.
- **Wear shoes that fit well.** Shop for shoes at the end of the day when your feet are bigger. Break shoes in slowly.
Use the table below to learn about common problems and what you can do.

<table>
<thead>
<tr>
<th>Body Part</th>
<th>Problem</th>
<th>How does it feel</th>
<th>What you can do</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feet</td>
<td>Nerves to the feet and legs have been harmed</td>
<td>• Tingling, numbness, burning sensation or pain</td>
<td>□ Have your doctor check your feet&lt;br&gt;□ Always wear shoes and socks</td>
</tr>
<tr>
<td>Legs</td>
<td>Poor blood flow</td>
<td>• Leg cramps, foot ulcers and infections&lt;br&gt;• May lead to amputations</td>
<td>□ Bring down your A1c, cholesterol, and blood pressure&lt;br&gt;□ Lose weight&lt;br&gt;□ If you smoke, quit&lt;br&gt;□ See your doctor</td>
</tr>
<tr>
<td>Kidneys</td>
<td>Damaged blood vessels let protein out in the urine</td>
<td>• You may not feel anything</td>
<td>□ Keep your sugar and blood pressure well managed&lt;br&gt;□ If the problem is severe, dialysis (machine to clean the blood) may be needed&lt;br&gt;□ Talk with your doctor about a treatment plan</td>
</tr>
<tr>
<td>Liver</td>
<td>Fat build up</td>
<td>• You may not feel anything</td>
<td>□ Lose weight&lt;br&gt;□ Talk with your doctor about treatment plan</td>
</tr>
<tr>
<td>Stomach</td>
<td>Nerves that control digestion are harmed</td>
<td>• Nausea, vomiting, slow digestion, diarrhea, and/or constipation</td>
<td>□ Eat small meals&lt;br&gt;□ Eat more foods with fiber&lt;br&gt;□ Eat less high fat foods&lt;br&gt;□ Stand or walk after eating&lt;br&gt;□ Get a referral to a dietitian</td>
</tr>
</tbody>
</table>
Unmanaged diabetes can slowly affect your organs and cause complications.

<table>
<thead>
<tr>
<th>Body Part</th>
<th>Problem</th>
<th>How does it feel</th>
<th>What can be done</th>
</tr>
</thead>
</table>
| Heart     | Blocked arteries | • You may not feel anything | □ Keep your sugar, blood pressure, and cholesterol well managed  
□ Eat heart-healthy foods  
□ Lose weight, if needed |
| Mouth     | Gum infection | • Gums may be red, swollen, or bleed | □ See your dentist regularly for cleaning |
| Eyes      | Blocked vessels in the back of the eye (retina) | • You may not notice anything  
• Or you may notice black spots | □ Get your eyes checked every year |
| Brain     | Poor blood flow can cause stroke or part of the brain to fail | • Weakness to one side of the body  
• Problems speaking  
• Loss of balance and severe headache | □ Keep your sugar, blood pressure, and cholesterol well managed  
□ Talk with your doctor about a prevention plan  
□ Stop smoking |

You may need other tests or screenings if you are at high risk. Talk with your doctor about a prevention plan.
Being sick can make your blood sugar level go up very high. The best way to prevent a minor illness from becoming a major problem is to have a Sick-Day Action Plan for sick days.

When you’re sick, your body is under physical stress. To deal with this stress, your body releases hormones that help fight the illness. These hormones have side effects. They raise blood sugar levels and do not let insulin work well.

When you’re sick it is harder to keep your blood sugar in your target range even if you are not eating.
Make a Sick-Day Action Plan

Work with your doctor or diabetes educator to prepare your Sick-Day Action Plan. The plan should include the following:

- When to call your doctor or diabetes team
- How often to test your blood sugar
- Which medications to take, how much to take, and when to take them
- What and how to eat
- A log to keep track of temperature, medication, foods, and blood sugar levels
- A list of phone numbers for your doctor, diabetes educator, and dietitian. Include how to reach your doctor at night, on weekends, and on holidays

Call your diabetes team if:

- You’ve been sick or have had a fever for a couple of days and aren’t getting better
- You’ve been vomiting or having diarrhea for more than 6 hours
- Your blood sugar levels are higher than 240
- You have symptoms that might signal dehydration or other serious problem:
  - Chest pain
  - Trouble breathing
  - Fruity smelling breath
  - Dry, cracked lips or tongue
- You aren’t sure what to do to take care of yourself
## Important Diabetes Exams

<table>
<thead>
<tr>
<th>Test</th>
<th>How Often</th>
<th>Date Completed</th>
